

EduNova AI - DBMS Test Material

Database Management System (DBMS)

A DBMS is software used to store, organize, retrieve, and manage data in a database.

Query Processing

Query processing converts an SQL query into an efficient execution plan. The main stages include parsing, translation, optimization, and execution.

Query Optimization

Query optimization chooses an efficient way to execute a query. It considers disk I/O, CPU cost, memory usage, and communication cost.

Selection Pushdown

Selection pushdown applies filtering conditions as early as possible. This can reduce the number of tuples processed by later operations such as joins.

Important Test Question

What is the purpose of query optimization? Answer: To choose an efficient execution plan that reduces the cost of executing a query.
